

VeinViewer® Flex

Fifth Generation of VeinViewer® Technology

BENEFITS YOU CAN CLEARLY SEE

VeinViewer® is the first and only device to use harmless near-infrared light and other patented technologies to project a digital image of patient vasculature directly onto the surface of the skin in real time, allowing you to see veins, bifurcations and valves thereby improving vascular access procedures, not just the needle stick.

VeinViewer® Flex is ideal for alternate care facilities as well as home healthcare and EMS. Designed for durability and maximum portability, the VeinViewer® Flex is also suited for hospital departments such as the ER and NICU where space requirements and speed of assessment demand an ultra-portable device based on proven VeinViewer® technology and reliability.

Patented AVIN™ (Active Vascular Imaging Navigation) technology allows you to see through the skin up to 10 mm.

Vascular Access Starts with VeinViewer®
